Pirouette® Indexing

Pirouette® window shadings have had a very successful product launch. Consumers are snapping up these innovative window shadings. It is important for you to know that Pirouette shadings are indexed from the top, which means that the bottom panel of the shading will vary in height depending on the drop of the shading. It is important that this be pointed out to the consumer during the sales process, if they will be installed in windows of different height.

When the fabric is manufactured, the accuracy of each vane placement is approximately the thickness of two business cards. However, even with this tight tolerance, the vane location on a 72" drop shade can vary as much as 3/4" between rolls of fabric. In addition to manufacturing tolerances, fabrication has a 1/8" variation due to the fabric cutting process. This limits our ability to guarantee equal bottom fabric panel heights.

Side-by-side shadings can be ordered with guaranteed bottom panel length if the shadings are:

1. Ordered at the same time
2. Are the same height
3. Are of the same mounting style, fabric and color

Here is a tip: If you have two shadings that are within 3/8" of each other in height, you should order the longer height for both to ensure the bottom panel lengths will be equal. However, if the windows are completely different in height from each other, then they will most likely have different sized bottom fabric panels, which you should notify your consumer of in advance.
